

Data exercise

1. Import the file "sampleinfo.txt" from:
<http://www.cbs.dtu.dk/r-intro/sampleinfo.txt>
save it as an object called "samp".
2. Convert the first column (Array) into a character vector.
3. Fix the "Age" column -- it should be numeric. (be careful)
4. Create a subset of "samp" that includes only rows for which "Expression.platform" is equal to "U133a". Call this object "samp2".
5. Sort "samp2" according to "Age".
6. Save "samp2" in the native R format, and also as a CSV file.
